Scales of atmospheric motion

(After Orlandi, 1975)

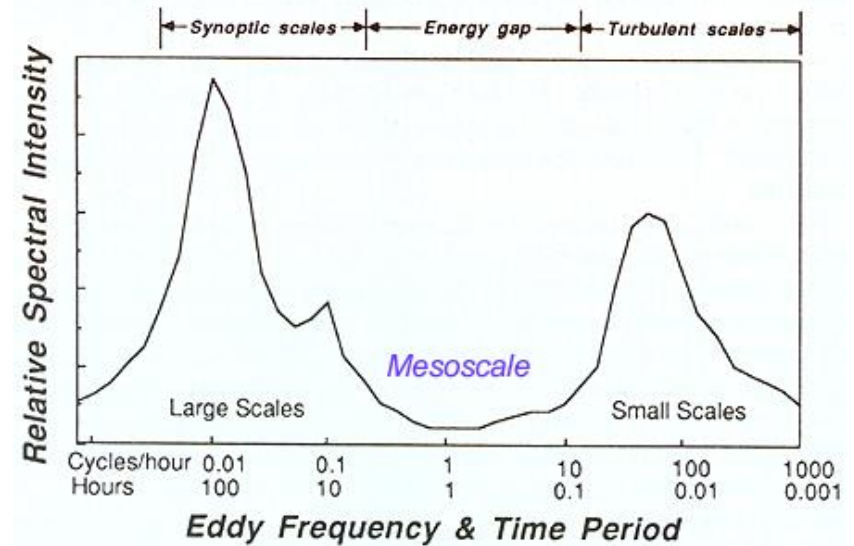

Fig. 2.2 Schematic spectrum of wind speed near the ground estimated from a study of Van der Hoven (1957). (from Stull, 1988)

Reynolds decomposition (1895)

$$x = \bar{x} + x', \text{ Flux} = \overline{wq} = \overline{wq} + \overline{w'q'}$$

Energy balance closure problem

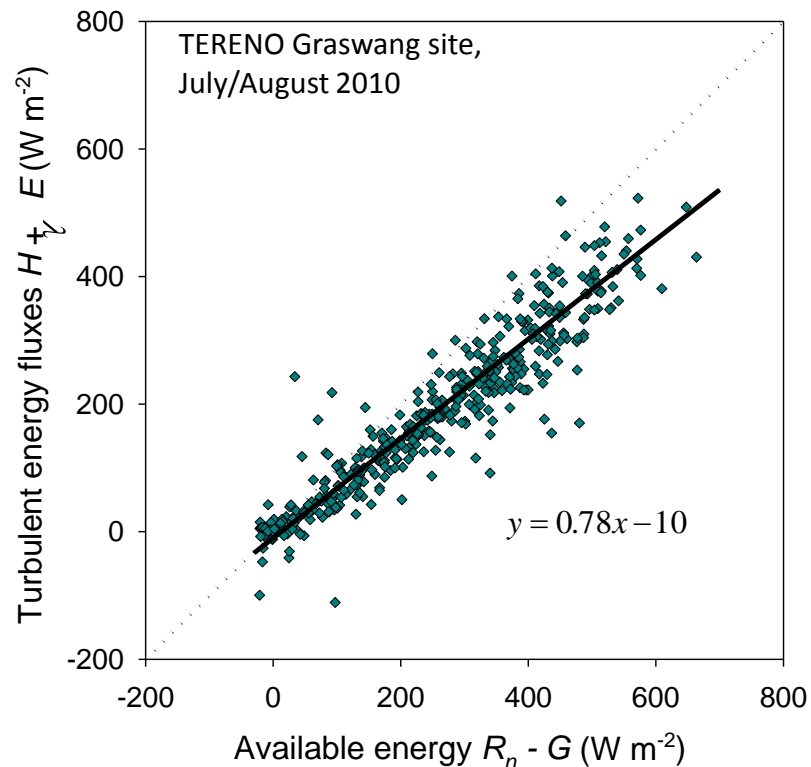

Eddy covariance energy balance station

$$R_n - G = \lambda E + H$$

H : sensible heat flux, R_n : net radiation

λE : latent heat flux, G : soil heat flux

Worldwide in-situ measurements show energy balance closure of **84% ± 20%**
(Stoy, Mauder et al., AFM, 2013, analysis of 180 FLUXNET sites)

One possible cause: Mesoscale transport

Hypothesis: mesoscale transport causes a systematic underestimation of tower flux measurements

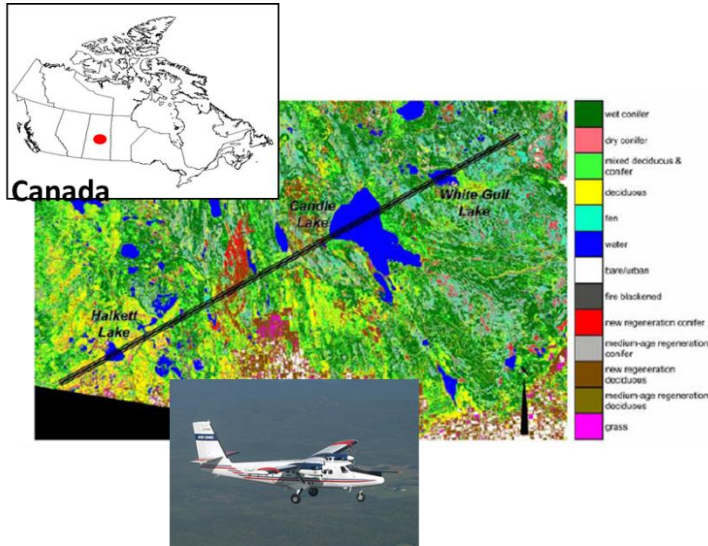

modified after

Mahrt (1998): Flux sampling errors for aircraft and towers, *Journal of Atmospheric and Oceanic Technology*

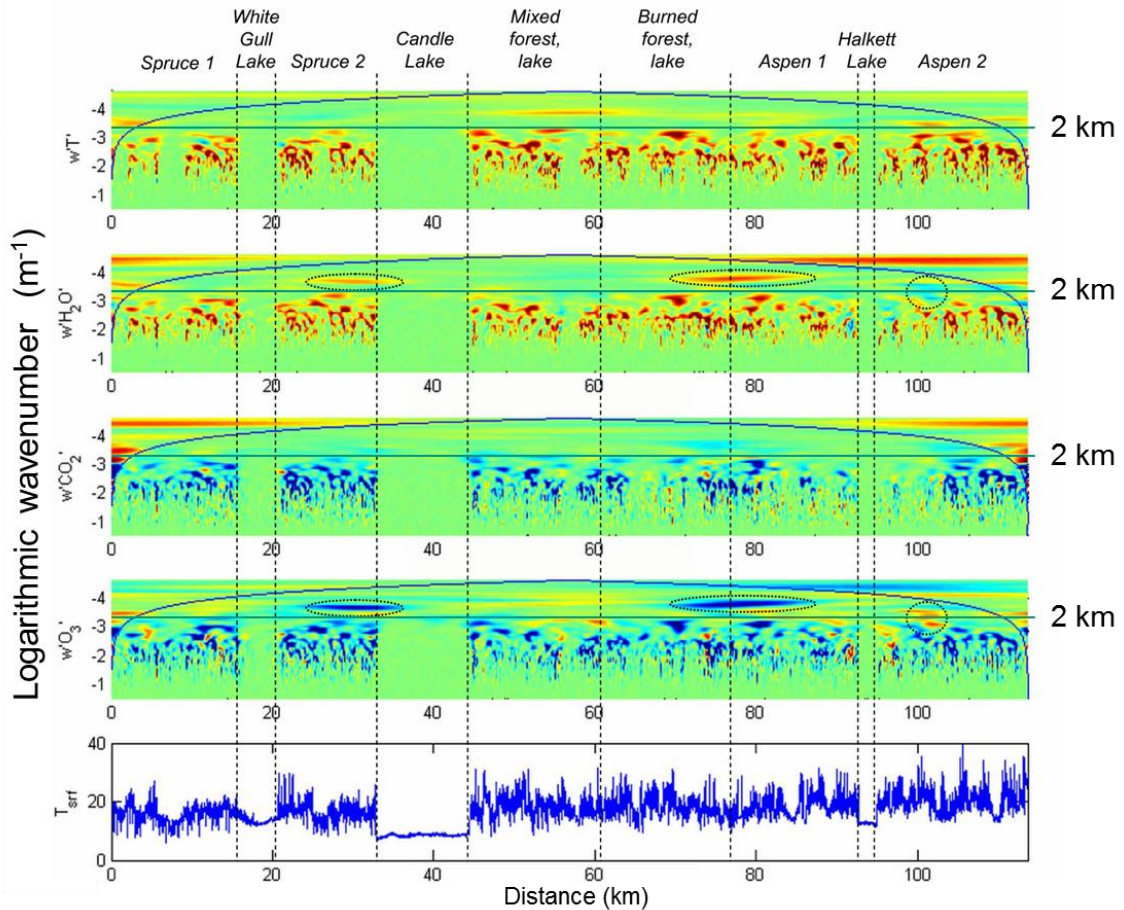

How large is mesoscale transport in the surface layer?

Candle Lake Runs (BOREAS/BERMS) @ 30 m measurement height

20 flights analyzed
 ⇒ **5 – 20% mesoscale**
 flux contribution (2 km)

(Mauder et al., 2007, JGR)

Eddy-covariance station
Selhausen

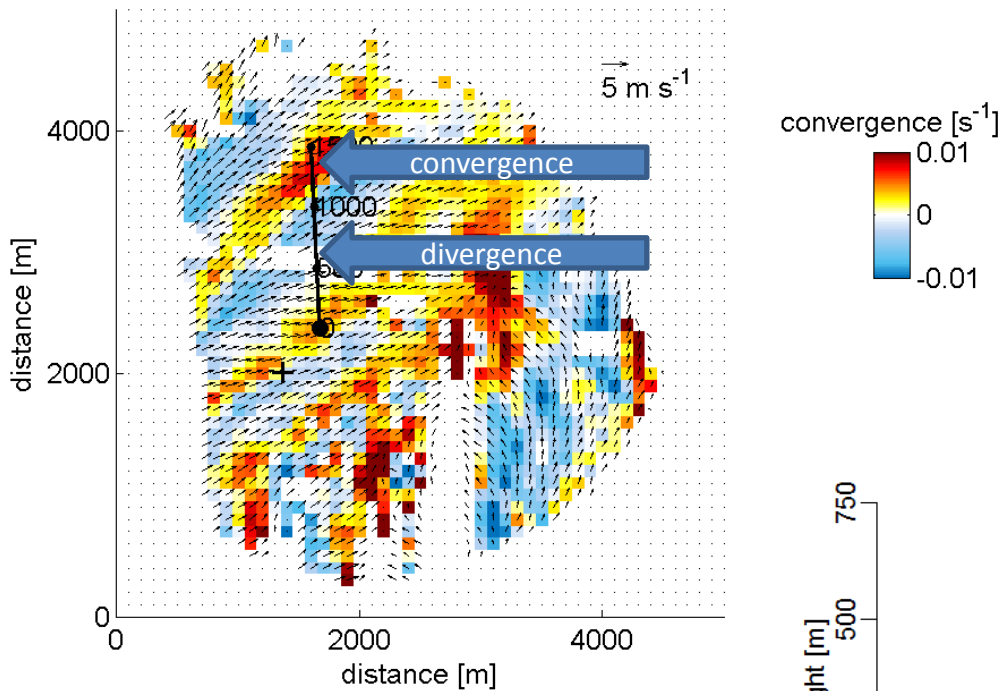

Streamline lidar

How close to the surface can mesoscale structures be found?

DUAL Doppler Lidar (KIT Cube)

17-04-2013 1030 – 1100 UTC
 $U = 3.0 \text{ m/s}$, $Dir = 225^\circ$

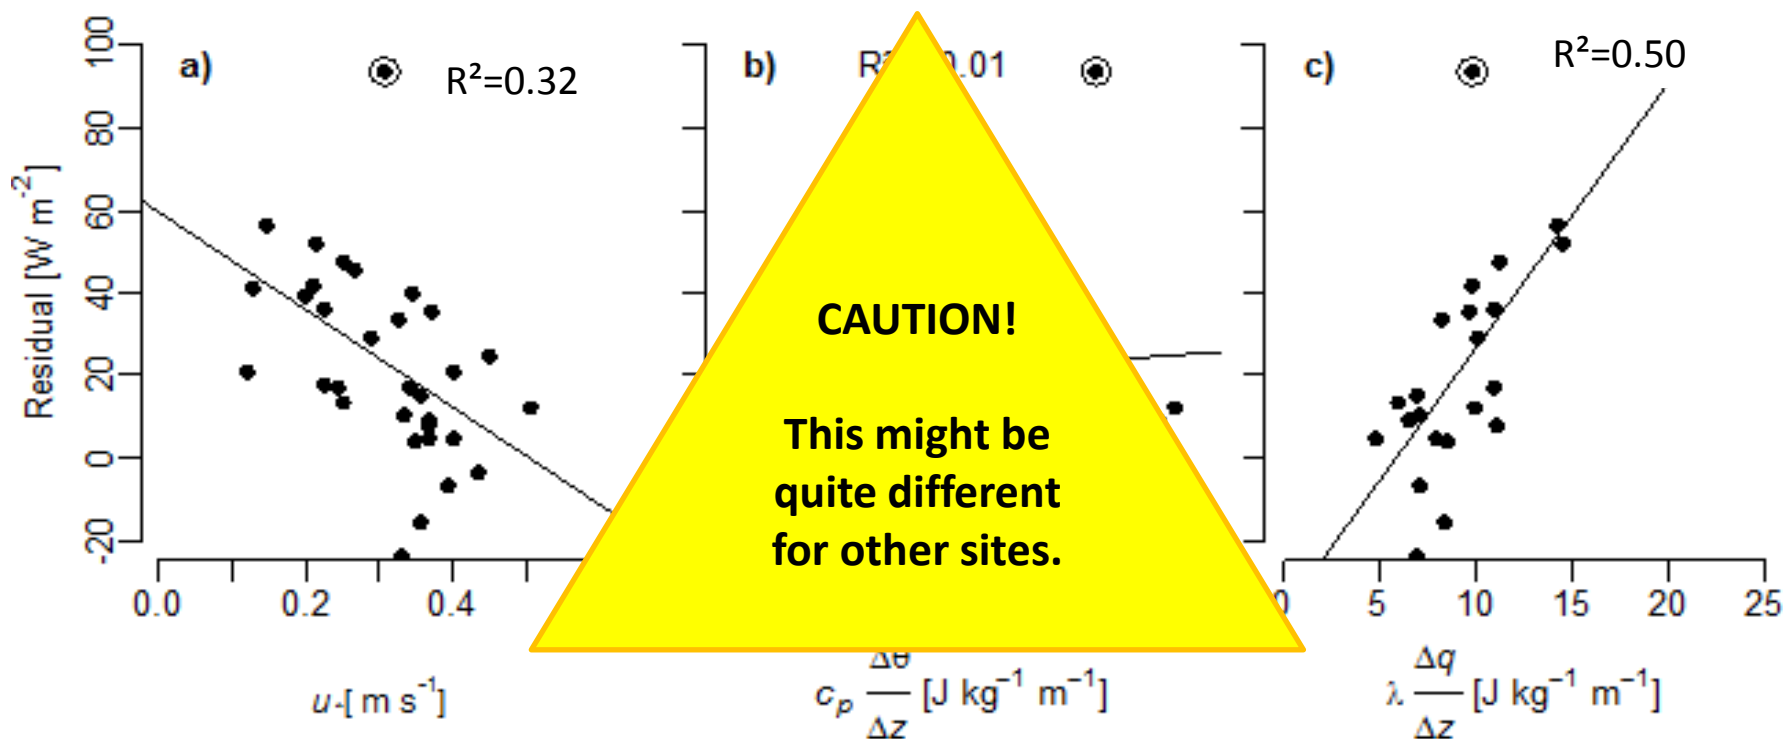

(Eder et al., JAMC, submitted)

RHI Scan (Halo Photonics)

What are potential predictors for the mesoscale flux contribution?

TERENO Energy balance station Selhausen + KIT HATPRO, April and May 2013

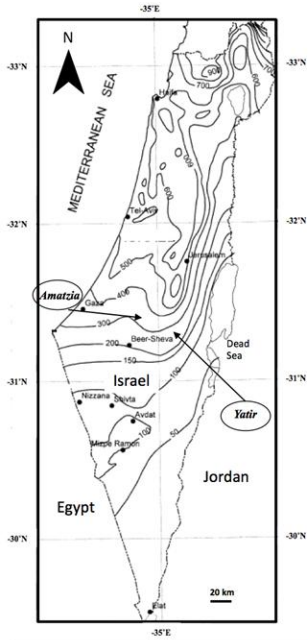

$$Residual = a_0 + a_1 \cdot 1/u_* + a_2 \cdot \lambda \Delta q / \Delta z: \text{multiple } R^2 = 0.60$$

(Eder et al., JAMC, submitted)

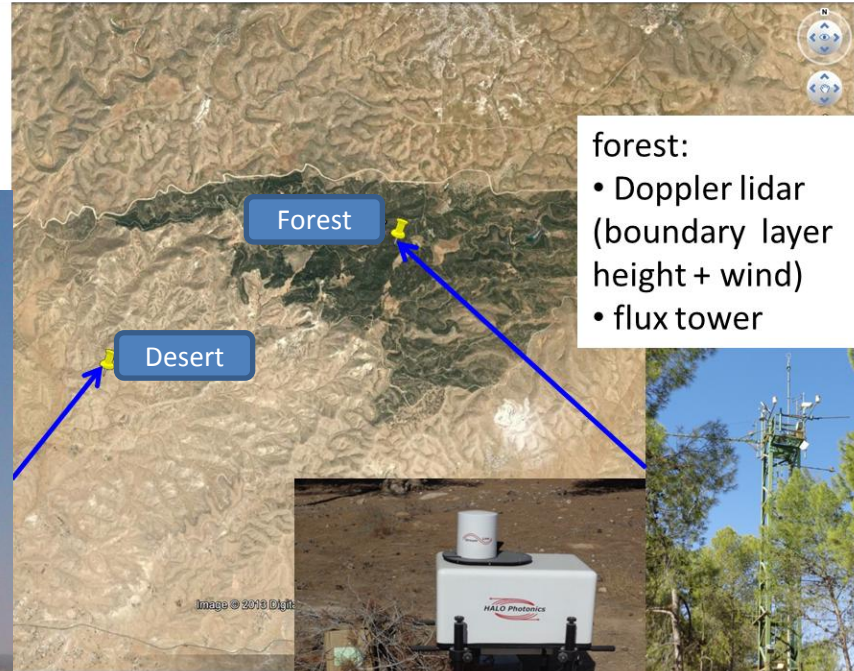

What is the effect of roughness/shear on mesoscale structures near the surface?

Yatir Forest, Israel

Aug/ Sept 2013

- desert:
- ceilometer (boundary layer height)
 - mobile flux tower

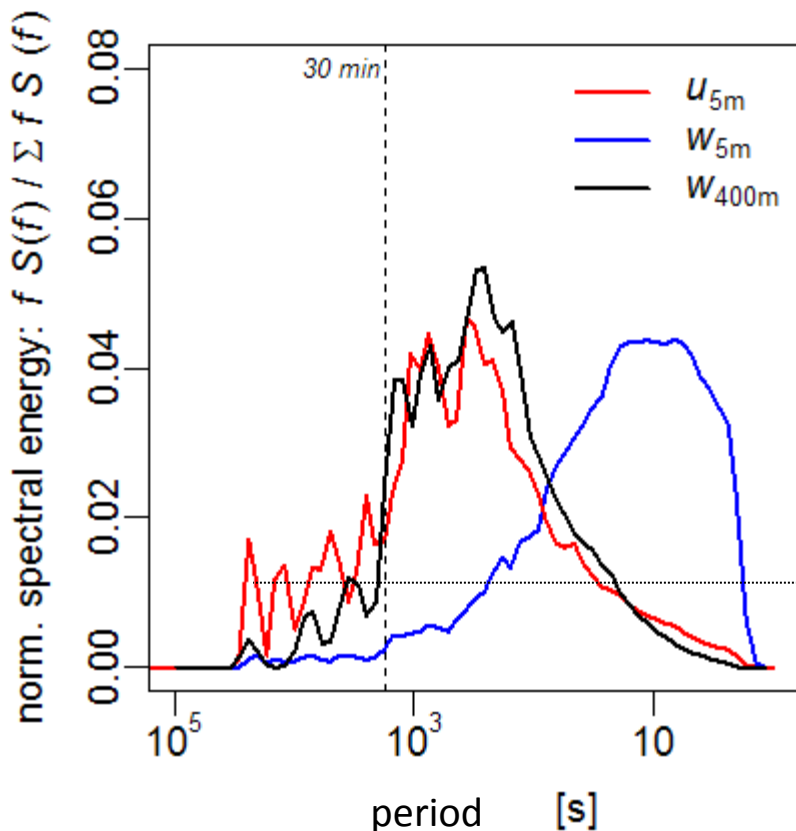

- forest:
- Doppler lidar (boundary layer height + wind)
 - flux tower

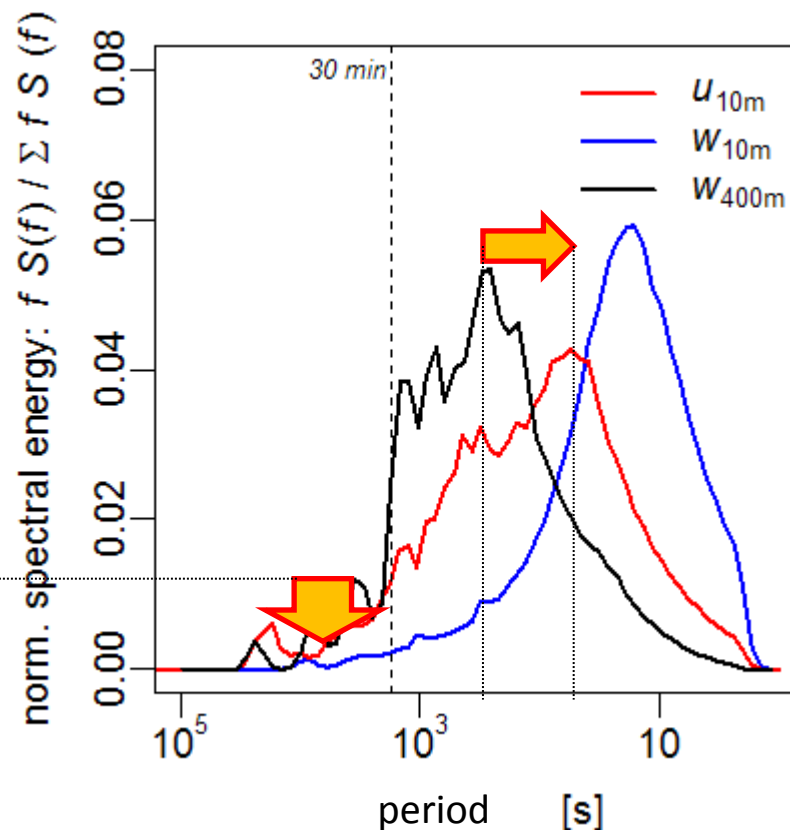

What is the effect of roughness/shear on mesoscale structures near the surface?

Desert: EBR = 0.76

Forest: EBR = 1.03

Data from two meteorological towers and one Doppler Lidar: 2013-08-23

Can we use the Bowen ratio to adjust tower fluxes?

Low level flights longer than 100 km

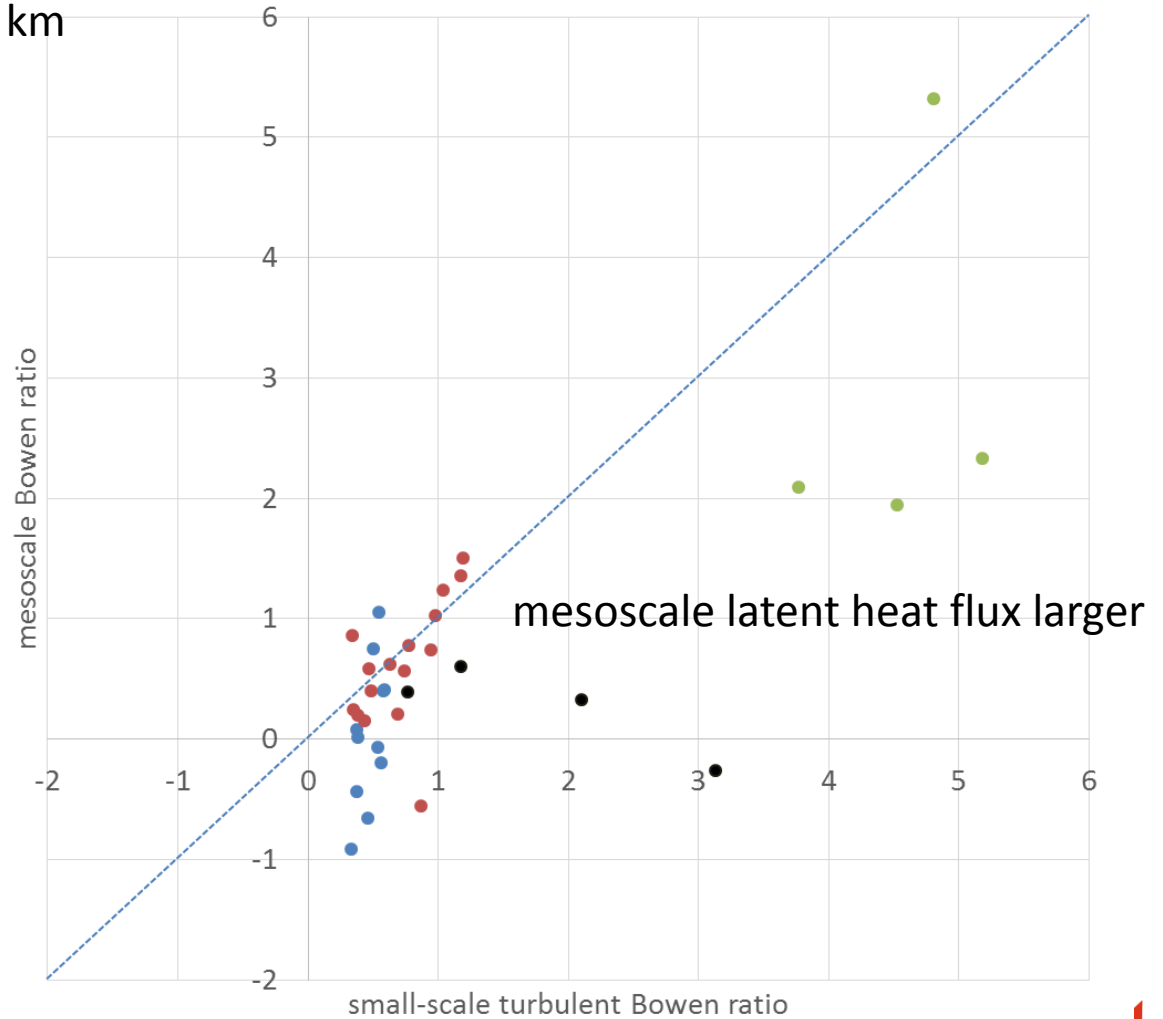

Polar 5 (AWI)

Twin Otter (NRC)

● Polar-5 Alaska 2012 ● Twin Otter Candle Lake 1994/95 ● Twin Otter Candle Lake 2002 ● Twin Otter Transect 1995

Conclusions

- Mesoscale transport can be **as large as the energy balance residual** in the surface layer.
- **Vertical gradients of temperature** and humidity explain a larger part of the systematic underestimation of eddy fluxes.
- In the roughness sub-layer, mesoscale structures **get broken up by shear** - then, the energy balance is closed.
- The mesoscale **Bowen ratio is not generally conserved**; we often found a larger portion of mesoscale energy exchange in λE .
