

M. Nicolaus, M. Hoppmann, C. Katlein, B. Rabe, F. Wenzhöfer, M. Schiller, D. Scholz & many more

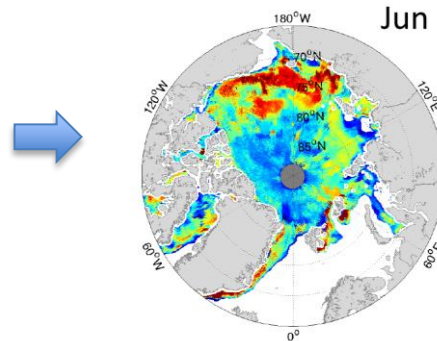

**Recent developments in remotely operated and autonomous technology for interdisciplinary sea ice observations**

# Challenge: The problem of scales

- High spatial variability on multiple scales
- Usual field observations: point measurements
- Sometimes: transects
- Upscaling: merge concepts with remote sensing and/or numerical models
- **Collect (much) more observations, across (much) larger areas!**

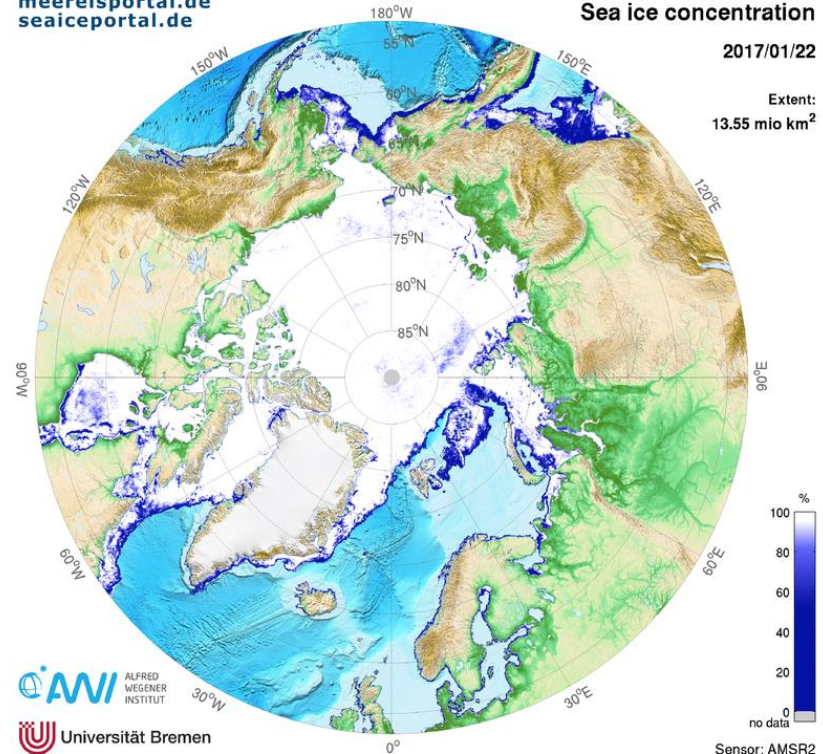

From Nicolaus et al. (2012, GRL)

From Arndt & Nicolaus (2014, Cryosphere)

meereisportal.de  
seaiceportal.de

AWI ALFRED WIEGENER INSTITUT  
Universität Bremen

Sensor: AMSR2

# Challenge: Seasonality

- Campaigns usually limited to summer
- Merging of campaigns in different seasons
- Again: connect field measurements to remote sensing and numerical models
- **Collect observations throughout all seasons!**
- (Manned observatories)

From Nicolaus et al. (2010, JGR)

# Challenge: Interdisciplinarity

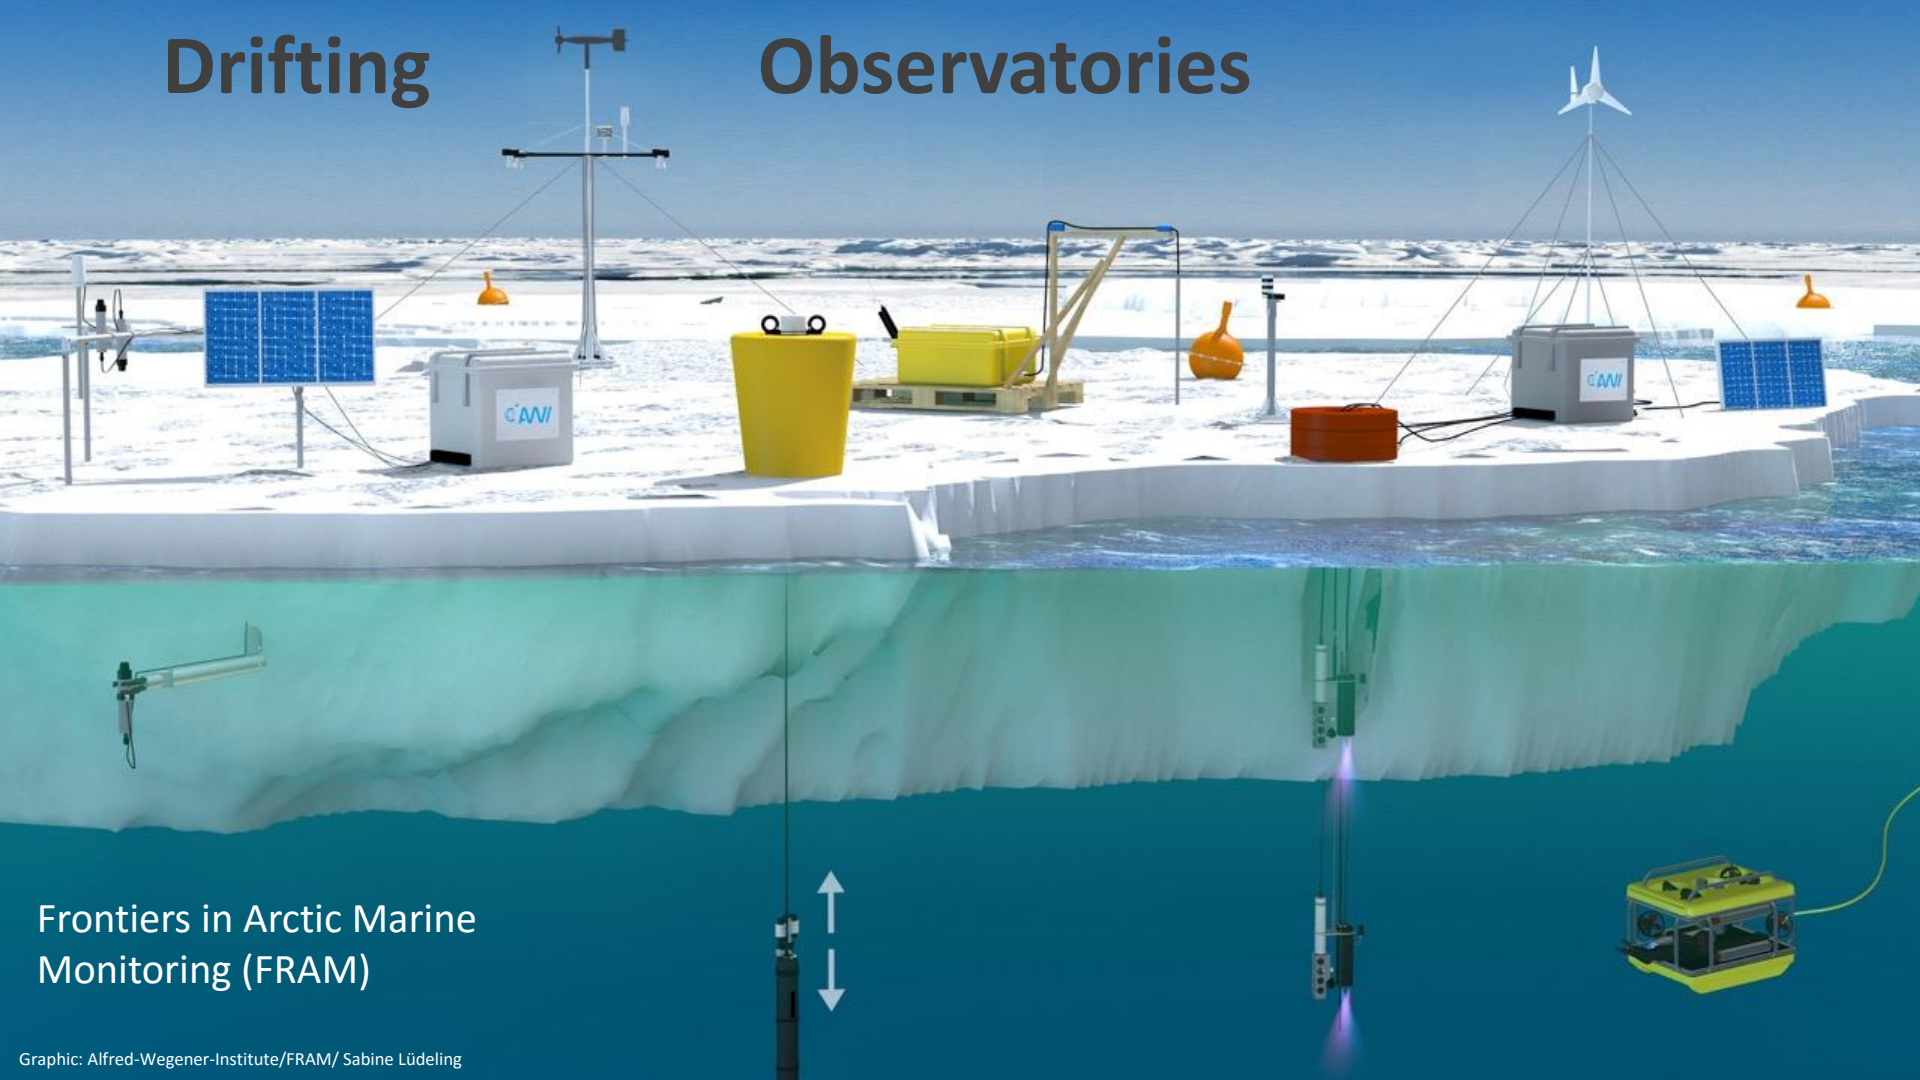

---

- Interaction between atmosphere, sea ice, snow & ocean
- Linkages between physics, biological processes, biogeochemical cycles
- Link to surface properties to use remote sensing
- Coupling of models
- **Measure all key parameters simultaneously**
- Coordinated studies, e.g. N-ICE 2015

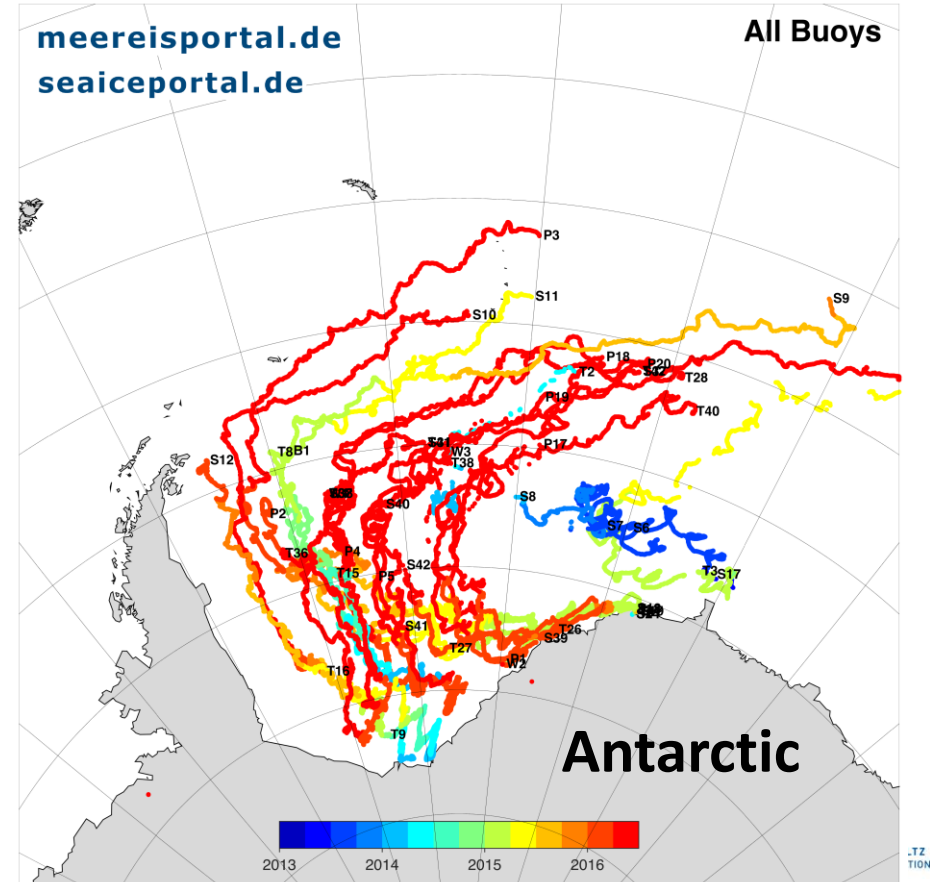

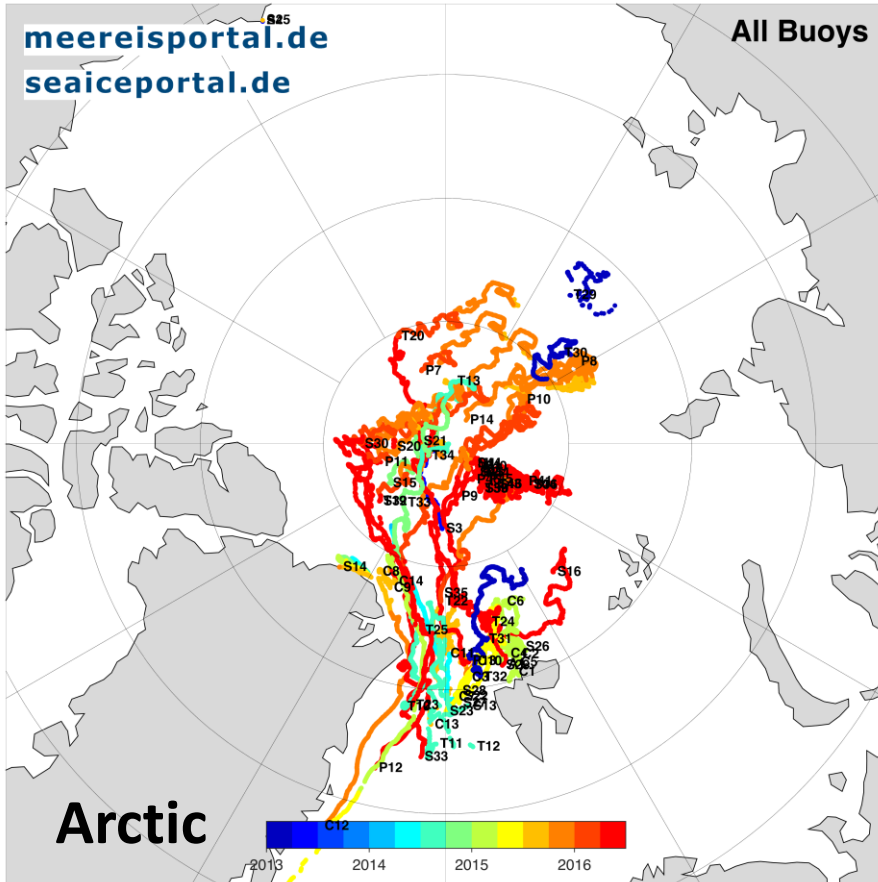

# Drifting

# Observatories

Frontiers in Arctic Marine  
Monitoring (FRAM)

# Increased temporal & spatial coverage

# Snow Buoys

## Snow is exceptionally important!

- Snow depth, air temperature, bar. pressure
- Variability on different scales
- Warm spells at the North Pole in winter
- Data into GTS => weather forecast
- Different behavior in Arctic vs. Antarctic
- Remote sensing ground truthing

Open data portal:

# Ice Mass Balance Buoys

## Key instrument in sea ice research

- Sea ice temperatures & thickness
- Sea ice mass & energy balance
- Air, snow, ocean temperatures, snow depth
- Thermal properties, internal melt, flooding, ponding, ...
- Suited for process studies and large scale estimates

## Current challenges

- Data processing & interpretation
- Synthesis analysis
- Link to other data types

# Bio-Optical Buoys / Bio-Profiler

## Advanced research platforms

- Profiling systems with physical, biological & biogeochemical sensors (5-800m), e.g. ITP (Woods Hole), IA00S (LOCEAN)
- Ice-tethered bio-optical Buoys (in & just below sea ice)
- Temperature, Salinity, Oxygen, PAR, Chl-a, CDOM, Backscatter, Nitrate

Bio-Optical Buoy Prototype deployment in 2016

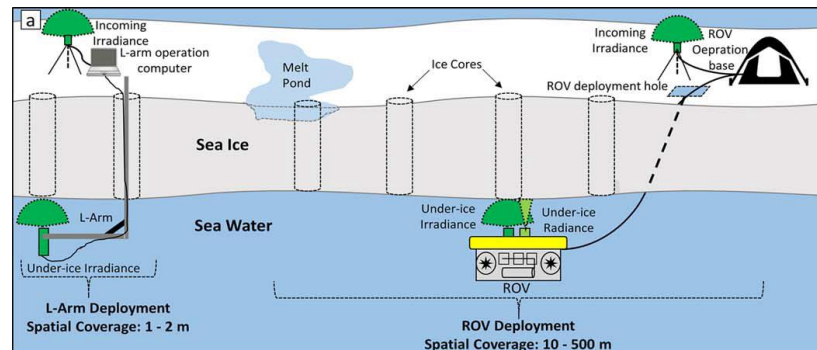

# A new under-ice robotic vehicle

## Ideal platform to bridge scales

(See Katlein et al. today @14:00)

From Lange et al. (2016, JGR)

- Operated from an ice floe
- Complex, interdisciplinary sensor suite
- Planned extensions (e.g. zooplankton)

# Road to

# MOSAIC

The International Arctic  
Drift Expedition

- Unique, year-long international drift experiment in 2019/20
- Focus: seasonal changes and their spatial variability
- Key processes as a function of seasonality and ice type
- Complete spectrum of parameters, processes, scales
- Effects of a changing ice pack
- **Drifting buoy observatories & ROV are key elements in this effort.**

# Thank you!
