

Supplementary Table I: Fatty acid composition (%) in all mesocosms at each sampling day. Only fatty acids accounting >1% in at least one sample are shown. Missing values are samples lost during analyses.

Supplementary Figure I: Temporal development of selected fatty acids ($\mu\text{g FA per mg C}$) during the experiment. Data from mesocosms with low CO_2 concentration (170-270 μAtm) are marked blue, those from mesocosms with intermediate CO_2 concentration (370-717 μAtm) are marked grey and those from mesocosms with high CO_2 concentration (544-1825 μAtm) are marked red. The different phases of the experiment are indicated (Phase 1= day -4 to 12, Phase 2= day 13 to 21, Phase 3= day 22 to 30).

Supplementary Figure II: Relationship between the amount of selected fatty acid markers (standardized to mg FA per mg C) against CO₂ concentration (µAtm) at different phases of the experiment. Amount of fatty acid markers and CO₂ concentrations were averaged over the time period of the three phases: Phase 1= day - 4 to 12, Phase 2= day 13 to 21, Phase 3= day 22 to end. A linear regression line is fitted to each data set. Asterisks (*) mark those relationships for which the linear regression analysis was statistical significant (p<0.05, see Supplementary Table III).

Supplementary Table III: Linear regression analyses of fatty acid markers (standardized to μg FA per mg C) against CO_2 concentration (μAtm) in different phases of the experiment. Amount of fatty acids markers and CO_2 concentrations were averaged over the time period of the three phases: Phase 1= day -4 to 12, Phase 2= day 13 to 21, Phase 3= day 22 to end. Entries in the table give the estimates for the intercept and the slope, the R^2 value and the statistical significant level given as p values and indicated as *** $p < 0.001$, ** $0.001 < p < 0.01$, * $0.01 < p < 0.05$)
