

# PANGAEA®

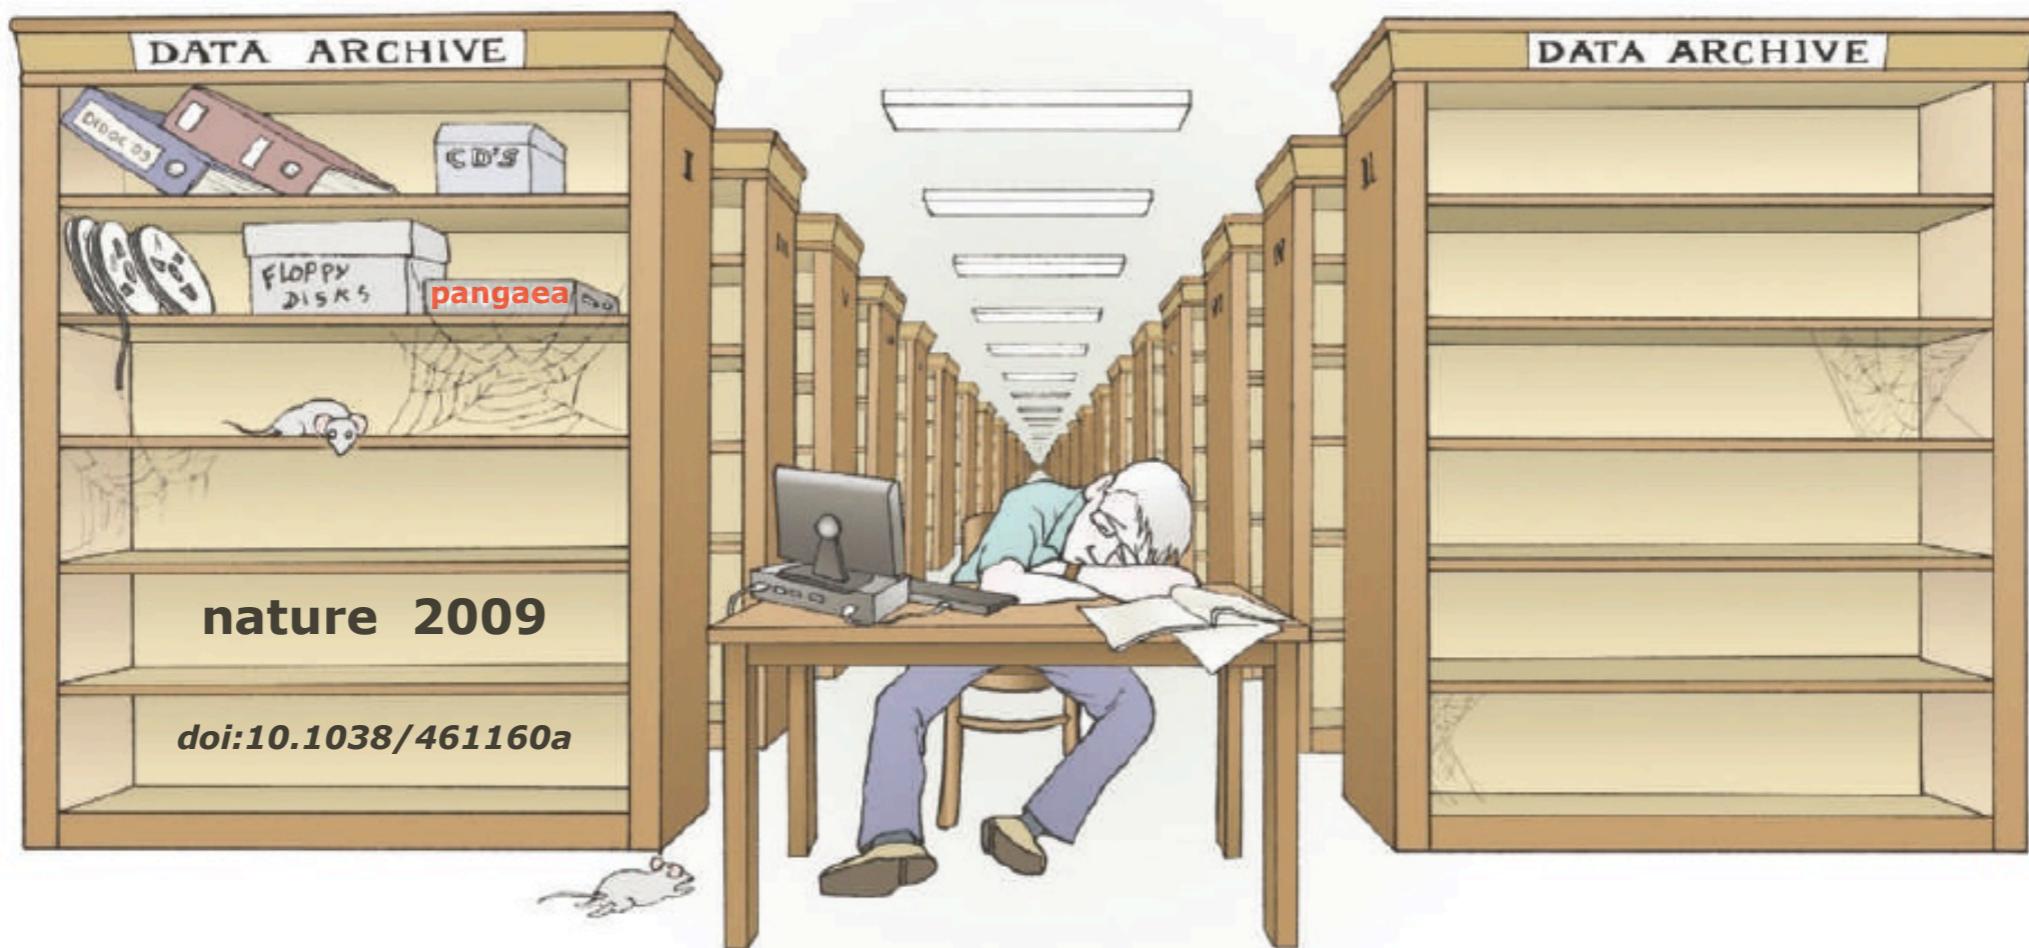

Data Publisher for Earth & Environmental Data

Hannes Grobe & Rainer Sieger

# Empty archives

Most researchers agree that open access to data is the scientific ideal, so what is stopping it happening? **Bryn Nelson** investigates why many researchers choose not to share.

In 2003, the University of Rochester in New York launched a digital archive designed to preserve and share dissertations, preprints, working papers, photographs, music scores — just about any kind of digital data the university's investigators could produce. Six months of research and marketing had convinced the university that a publicly accessible online archive would be well received. At the time of the launch, the university librarians were worried that a flood of uploaded data might swamp the available storage space.

Six years later, the US\$200,000 repository lies mostly empty.

or didn't understand how to use the archive, or lamented that they just didn't have any more hours left in the day to spend on this business.

As Gibbons and anthropologist Nancy Fried Foster observed in their 2005 postmortem<sup>1</sup>, "The phrase 'if you build it, they will come' does not yet apply to IRs [institutional repositories]."

A similar reality check has greeted other data-sharing efforts. Most researchers happily embrace the idea of sharing. It opens up observations to independent scrutiny, fosters

data. Physicists, mathematicians and computer scientists use arXiv.org, operated by Cornell University in Ithaca, New York; the International Council for Science's World Data System holds data for fields such as geophysics and biodiversity; and molecular biologists use the Protein Data Bank, GenBank and dozens of other sites. The astronomy community has the International Virtual Observatory Alliance, geo-

scientists and environmental researchers have Germany's Publishing Network for Geoscientific & Environmental Data (PANGAEA),

"We got the software up and running and said 'Give us your stuff'. That's

# What is PANGAEA ?

- Data **publisher** open to the scientific community
- Data **library** for earth system research
- Relational database with linked tape archive
- Data are stored **georeferenced** in space and time
- Distribution via web services
- Data warehouse

Hi again,

I changed the parameter in the data-file (check: <http://doi.pangaea.de/10.1594/PANGAEA.843554>), if you want to change that in the pdf (we probably should), please attach the corrected version, best today, so I can substitute it with the[Read more >](#)

Hi Amelie,

Thanks a lot.  
I would greatly appreciate if you change one last thing:I have noted that the parameter #39 should be 'PmaxB, Production rate, maximal, light saturated, in carbon of chlorophyll a' which is in [mgC/mgChl-a/h]. This is a

[Amelie Buecker commented on PDI-9618 - POS317/3](#)

Was mir noch auffällt ist, dass wir einmal "multi-beam" und einmal "multibeam" als Titel haben. Kann man sich da auf eines einigen? LG Amelie

# Thomson Reuters Unveils Data Citation Index for Discovering Global Data Sets

Fri Jun 22, 2012 8:32am EDT

\* Reuters is not responsible for the content in this press release.

*First of Its Kind Data Citation Index Connects Researchers to Data Repositories around the World*

**Philadelphia, PA, June 22, 2012** - The Intellectual Property & Science division of Thomson Reuters announced today that it will preview at the American Library Association Conference (ALA) the *Data Citation Index*™, an upcoming research resource within the *Web of Knowledge*SM to facilitate the discovery, use and attribution of data sets and data studies, and link those data to peer-reviewed literature.

more sea ice to grow and HSSW and, subsequent, WSBW to form, could compensate the glacial melt-water-induced WSBW formation.

Further investigations in the western Weddell Sea are necessary to confirm the findings to date and to investigate the temporal evolution. So far, we have strong indications for HSSW and glacial melt water to originate from the western Weddell Sea continental shelf, including Larsen C Ice Shelf. The spatial structure of the flow and its temporal variability just starts to become known. Bathymetric maps more reliable than those available for this area to date would be extremely helpful to interpret the results and to plan further surveys. Previous cruises to the east of the Antarctic Peninsula (in the area of LIS, i.e., ISW-1 and ISPOL) drifted within the Weddell Gyre's western rim, parallel to the slope. Hydrographic and tracer sections perpendicular to the mean flow, covering the continental shelf and slope, are desirable. They could provide a better estimate on local WSBW formation and on the relation between glacial melt water and HSSW driven processes. Furthermore, these measurements have to be related to the observed temporal changes of bottom water characteristics in the northwestern Weddell Sea (Robertson et al., 2002; Schröder et al., 2002; Nicholls et al., 2004; Fahrbach et al., 2004). Hydrographic and tracer observations are always snapshots in time and space and can usually not be conducted directly at the sources in this hardly accessible and remote area. They might be complemented by model simulations that are validated by the available hydrographic and tracer observations, including those of the present study. They also could improve our understanding of the complex interaction of temporally open or sea ice covered continental shelves, the ice shelves, and the ocean interior.

#### Acknowledgments

We thank the master and the crew of R.V. *Polarstern*, the helicopter team, and the ISPOL scientific party for excellent and fruitful cooperation. Special thanks to K. Bulsiewicz, G. Fraas, W. Plep, J. Süttenfuß, and their student assistants for their excellent work in our CFC and noble gas lab. Further thanks to A. Wisotzki for analysis and assessment of the hydrographic data obtained during ISPOL and to K.-P. Lieckfeldt and M. Schodlok for their assistance during the noble gas and CFC sampling. We also thank K. Heywood and one anonymous reviewer for their helpful comments and suggestions. The tracer measurements and the data analysis carried out by O. Huhn were funded by the Deutsche Forschungsgemeinschaft (DFG), as part of Schwerpunktprogramm Antarktisforschung (SPP 1158).
